

0805 Light Control Sensor Module

Thus, when the PCM detects an abnormal voltage or resistance in the clutch position sensor or its control circuit, it will set code P0805 as a result, and depending on the application, may ...

The P0805 trouble code technically means "Clutch Position Sensor Circuit Malfunction". Here's exactly what you need to do to fix it.

When the PCM (powertrain control module) detects a problem with the clutch position sensor (also referred to as the clutch start switch) in a manual transmission vehicle, the P0805 code is stored and ...

How to quickly diagnose and repair, and causes of a P0805 trouble code which indicates a detected malfunction in the clutch position sensor circuit.

This code means the sensor is sending wonky signals to your engine control module. Your car's brain needs to know where that clutch pedal is at all ...

The P0805 code indicates a fault in the clutch position sensor circuit. This sensor is responsible for detecting the position of the clutch pedal in manual transmission vehicles. The sensor sends signals ...

This sensor detects the position of the clutch pedal, informing the vehicle's powertrain control module (PCM) about driver inputs. If the sensor signal is missing, out of range, or inconsistent, the PCM sets ...

P0805 indicates a fault detected in the clutch position sensor circuit. This is an electrical circuit-type DTC, meaning the control module has determined the clutch position input signal is not ...

When the PCM or TCM detects improper voltage or resistance within the clutch position sensor circuit, code P0805 will be set and the check engine light or the transmission warning lamp will be illuminated.

This code means the sensor is sending wonky signals to your engine control module. Your car's brain needs to know where that clutch pedal is at all times, and when it doesn't, it throws a ...
