

Battery Classification in Communication Equipment Rooms

There are a wide number of standards and codes that apply to battery systems and battery rooms. At the local level, the ones that matter most are the Fire Codes.

This article outlines the key requirements for telecom batteries used in indoor equipment rooms, with a focus on system design considerations rather than specific battery chemistries.

It specifies requirements for safety venting, thermal runaway protection, location and separation based on occupancy, spill control, neutralization, ventilation, environment control, signage, seismic ...

Two primary fire codes (International Fire Code (IFC) and NFPA 1: Fire Code) define the appropriate construction and supporting infrastructure that must be provided for storage battery rooms.

ATIS Standards and guidelines address 5G, cybersecurity, network reliability, interoperability, sustainability, emergency services and more...

This standard covers requirements including procedures to identify and manage contaminants and atmospheric conditions that can be present in telecommunications battery rooms and enclosures.

A Battery Room built to the requirements of Article 480 does not need to be classified. In other words, you don't need to declassify what wasn't needed to be classified in the first place.

Safety requirements for batteries and battery rooms can be found within Article 320 of NFPA 70E

Batteries of the unsealed type shall be located in enclosures with outside vents or in well ventilated rooms and shall be arranged so as to prevent the escape of fumes, gases, or electrolyte spray into ...

The types of energy storage covered under this standard include electrochemical, chemical, mechanical and thermal. The energy storage system shall be constructed either as one unitary complete piece of ...

When more than one battery chemistry is employed, locate each type of battery in a separate room with each room individually meeting the occupancy separation requirements and with no direct access ...
